

IFS Class Diagram

Class diagram connections:

- **SwitchTask to AudioManager:**
 - Connection: **Association**.
 - Purpose: SwitchTask uses AudioManager to play audio files.
- **SwitchTask to DrowsinessDetection:**
 - Connection: **Directed Association**.
 - Purpose: SwitchTask starts/stops the DrowsinessDetection process based on the switch state.
- **DrowsinessDetection to AudioManager:**
 - Connection: **Aggregation**.
 - Purpose: DrowsinessDetection uses AudioManager to play alerts and DrowsinessDetection does not function properly without the ability to generate alerts.
- **DrowsinessDetection to CameraManager:**
 - Connection: **Composition**.
 - Purpose: DrowsinessDetection fully owns and manages the CameraManager lifecycle.
- **DrowsinessDetection to EyeMouthDetector:**
 - Connection: **Directed Association**.
 - Purpose: DrowsinessDetection uses EyeMouthDetector to analyze facial feature ratios.

Class diagram explanation:

SwitchTask:

- **Purpose:** Manages the switch state, controls whether the drowsiness detection script is running and plays audio reminders if the switch is off.
- **Attributes:**
 - SWITCH_PIN: GPIO pin connected to the switch (GPIO17, pin number is 11).
 - process: Tracks the subprocess running the detection script.
 - last_played: Timestamp for the last reminder.
- **Methods:**
 - listen_switch(): Continuously checks the switch state.
 - play_audio(): Plays audio reminders.
 - run_script(): Runs the drowsiness detection script when needed.
 - stop_script(): Stops the drowsiness detection script when needed.

DrowsinessDetection:

- **Purpose:** Implements the logic for detecting drowsiness using the camera input, analyzing eye and mouth ratios, and playing alerts.
- **Attributes:**
 - camera: Camera device used for capturing video frames.
 - face_mesh: MediaPipe FaceMesh model for detecting facial landmarks.
 - closed_start_time & yawn_start_time: Track the timing for eye closure and yawning events.
 - closed_alert & yawn_alert: Flags for detected alerts.
 - sleepy_detected & yawn_detected: Flags for detected states.
- **Methods:**
 - start_detection(): Starts the detection process.
 - stop_detection(): Stops the detection process.
 - detect_eye_closure() & detect_yawn(): Detect eye closure and yawning based on ratios.
 - yawn_alert_func() & closed_alert_func(): Trigger alerts for detected states.

EyeMouthDetector:

- **Purpose:** Provides the calculations of ratios for eyes and mouth using facial landmark data.
- **Attributes:**
 - left_eye_ids & right_eye_ids: Landmark IDs for detecting eyes.
 - lip_ids: Landmark IDs for detecting mouth.
- **Methods:**
 - calculate_eye_ratio(): Computes the eye aspect ratio to detect closures.
 - calculate_mouth_ratio(): Computes the mouth aspect ratio to detect yawning.

AudioManager:

- **Purpose:** Handles playing audio files for notifications, reminders, and alerts.
- **Attributes:**
 - file_paths: Stores paths to audio files.
- **Methods:**
 - play_audio(): Plays a specified audio file.

CameraManager:

- **Purpose:** Manages camera initialization and cleanup operations for video capturing.
- **Attributes:**
 - camera: Represents the connected video capture device.
- **Methods:**
 - initialize_camera(): Sets up the camera.
 - release_camera(): Releases the camera when not in use.
